

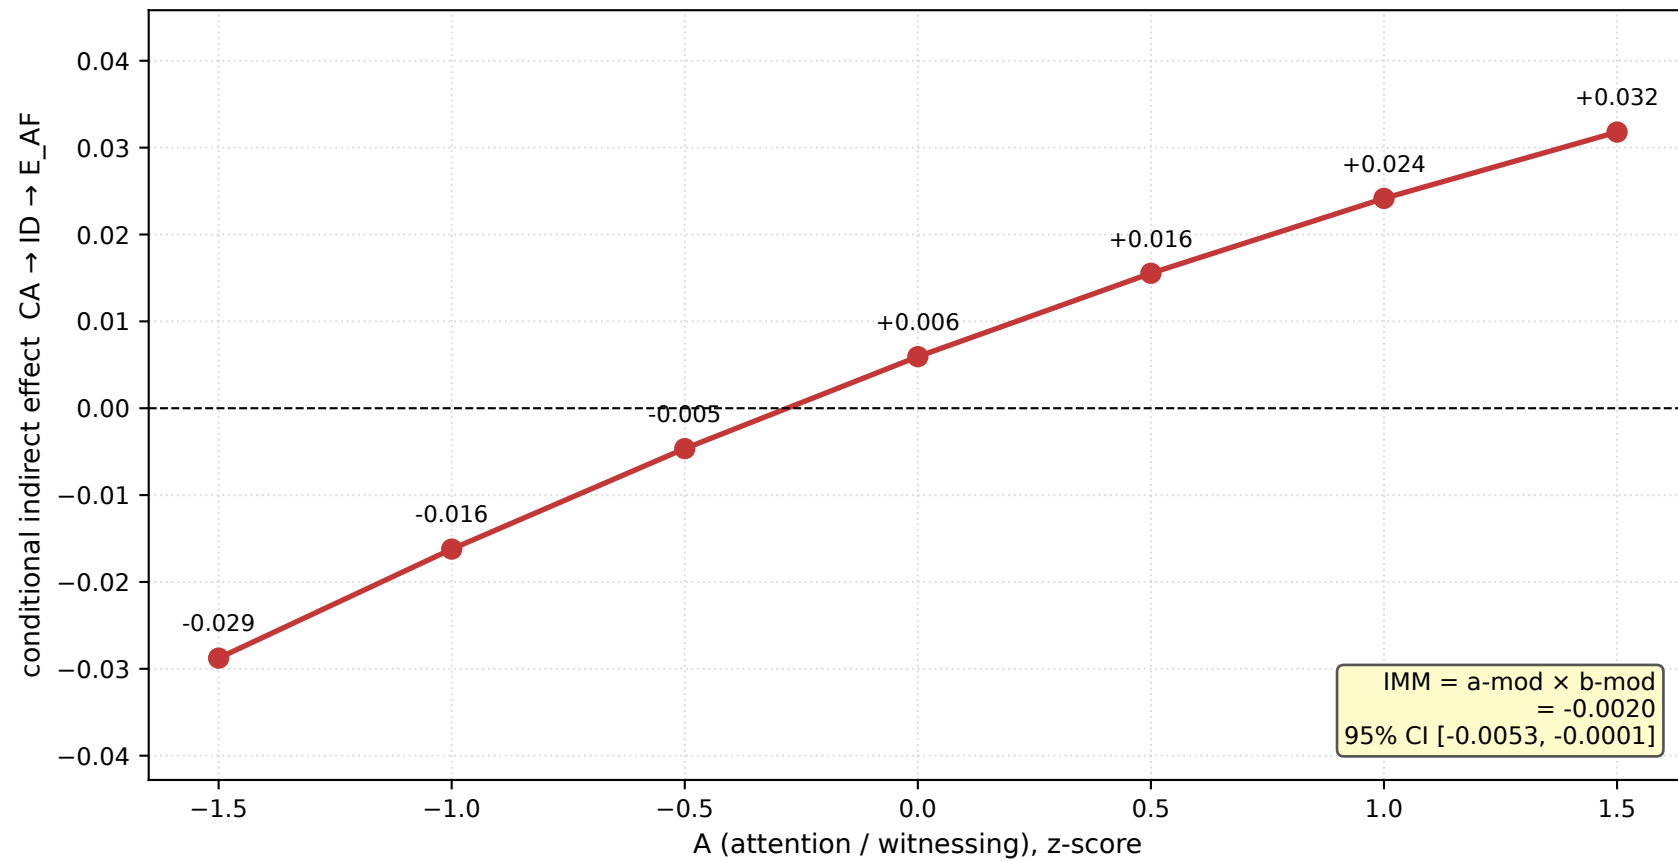

Figure 6. CA → ID → E_AF indirect effect flips sign through A (tier-4 SEM, N = 710)

At low A, elevated CA → ID → E_AF suppresses empathy (classical trauma channel). At high A, the same indirect flips positive. The IMM is small but robust direction (see Figure 3 for Bayesian reanalysis). In the unified model (Figure 1) this channel becomes secondary to P → E_AF, i.e. the story is not primarily about dissociation but about the moral narrative axis.
